Method for designing artificial protein - useful for producing proteins with required functions

Japanese. Example; Page 4-5; 10pp;

The present invention describes a method for producing an ideal amino acid sequence. The method comprises: (1) preparation of one initial amino acid sequence corresponding to the structure of a protein; (2) selecting the amino acid residues optimal to each site; (3) repeating the steps of selecting the amino acid residues optimum to each sites of the total amino acid residues optimum to each sites of the total consisting of the selected amino acid sequence (N is an integer not less than 2) to give an N+1-order amino acid sequence consisting of the selected amino acid sequence comes to be same as the N+1-order amino acid sequence; and (4) selecting the resultant N-order amino acid sequence as the optimum amino acid sequence of said protein. The method can design a protein with desired functions and properties. The present sequence represents sperm whale myoglobin used in an example from the present invention where the stere structure of sperm whale myoglobin was targeted as a globular protein to detect an amino acid sequence best fit to the structure of the

```
This sequence represents the MYGL protein. The invention relates to a database containing information on the amino acid (aa) sequences of proteins of which I or more biological functions are known. The database also contains additional information on the score of importance of each as residue in the whole as sequence in determining the known biological functions. The invention also relates to a method of preparing an alignment between as sequence in determining the known biological functions. The scar being is represented as the homology amongst various sites, each being identified as having a high score of importance in determining potential biological functions. The method is used to enable an efficient estimation of the biological functions (particularly sequences. Suitable proteins can then be isolated and purified by various means. This could be of considerable use in a biological and medical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 LKKHGVTVLTALGAILKKKGHHEAELKPLAQSHATKHKPIFVKYLEFISBAIHVLHSRHP 120

The database is useful for determination of unknown biological function of a protein or polypeptide based on the homology of amino acid sequence, e.g. steric structure of protein, and includes retrieval and evaluation of high homologous relationship for the determination of mostly resembling protein. The database allows for correct and rapid retrieval and presumption of

This present sequence contains a substitution at Lys45Glu, which has been found to enhance the peroxidase activity of the protein in general, and it may also exhibit enhanced Mn(II) peroxidase activity as well. This is due to the enhanced rate of reaction of Fe(III) Mb with hydrogen peroxide and also because the substitution at residue 45 creates a new Mn binding site which is stronger than the natural Mn binding site of Mb. These protein can be used to catalyse oxidation of a substrate by peroxidase, e.g. oxidation of Mn2+. Peroxidases are used for oxidising phenolics to polymers, as labels for e.g. antigens, antibodies or originate contains the manipulation of a configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configuration of the configurati

```
Sequences AAM62270-W62273, and AAW29739-W29744, are modified synthetic horse heart myoglobin (Mb) proteins, produced by random mutagenesis of the synthetic Mb gene. This present sequence contains a substitution at Ile107Phe which has been shown to enhance the peroxidase activity of Mb. These protein can be used to catalyse oxidation of a substrate by peroxidase, e.g. oxidation of Mn2+. Peroxidases are used for oxidising phenolise to polymers, as labels for e.g. antigens, antibodies or oligonucleotides, in diagnostic assays and for oxidative treatment of waste streams. NB. This sequence is not given in the specification but was created from the wild type sequence given by the inventors. The position of the substitution given does not include the initiation codon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New modified myoglobin with amino acid alterations has increased peroxidase activity - used for catalysing oxidation of substrates with peroxides, e.g. in waste treatment and as label for antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 154;

This present sequence contains a substitution at Thr39Tle which has been shown to enhance the peroxidase activity of Mb. These protein can be used to catalyse oxidation of a substrate by peroxidase, e.g. oxidation of Mat. Peroxidases are used for oxidising phenolics to polymers, as labels for e.g. antigens, antibodies or oligonucleotides, in diagnostic assays and for oxidative treatment of waste streams. MB. This sequence is not given in the specification but was created from the wild type sequence given by the inventors. The position of the substitution given does not include the initiation codon

NB. This sequence is not given in the specification but was created from the wild type sequence given by the inventors. The position of the substitution given does not include the initiation codon
                                                                                                                                                                                                                                                                                                                         Sequences AAW62270-W62273, and AAW29739-W29744, are modified synthetic horse heart myoglobin (Mb) proteins, produced by random mutagenesis of the synthetic Mb gene. This present sequence contains a substitution at phe46Leu which has been shown to enhance the peroxidase activity of Mb. These protein can be used to catalyse oxidation of a substrate by peroxidase, e.g. oxidation of Mn2+. Peroxidases are used for oxidising phenolics to polymers, as labels for e.g. antigens, antibodies or oligonucleotides, in diagnostic assays and for oxidative treatment of waste streams. NB. This sequence is not given in the specification but
                                                                    New modified myoglobin with amino acid alterations has increased peroxidase activity - used for catalysing oxidation of substrates with peroxides, e.g. in waste treatment and as label for antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..

Sequences AAW62270-W62273, and AAW29739-W29744, are modified synthetic horse heart myoglobin (Mb) proteins, produced by random mutagenesis of the synthetic Mb gene. This present sequence contains a substitution at Lya45Glu, which has been found to enhance the peroxidase activity of the protein in general, and it may also exhibit enhanced Mn[II] peroxidase activity as well. This is due to the enhanced rate of reaction of Fe[III] Mb with hydrogen peroxide and also because the substitution at residue 45 creates a new Mn binding site which is stronger than the natural Mn creates a new Mn binding site which is stronger than the natural Mn binding site of Mb. This protein also contains a substitution at contains a substitution at contains a substitution of creates also found to be required for Mn binding. These contoins can be used to catalyse oxidation of a substrate by peroxidase, e.g. oxidation of Mn24. Peroxidases are used for oxidising phenolics to diagnostic assays and for oxidative treatment of waste streams. NB. This sequence is not given by the inventors. The positions of the substitutions cytype sequence given by the intitiation codon

This present sequence contains substitutions at Phe46feu and 11e107Phe which have been shown to enhance the peroxidase activity of Mb. These protein can be used to catalyse oxidation of a substrate by peroxidase, e.g. oxidation of Mn2+ Peroxidases are used for oxidising phenolics to polymers, as labels for e.g. antigens, antibodies or oligonucleotides, in diagnostic assays and for oxidative treatment of waste streams. NB. This sequence is not given in the specification but was created from the wild type sequence given by the inventors. The positions of the substitutions given do not include the initiation codon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New modified myoglobin with amino acid alterations has increased peroxidase activity - used for catalysing oxidation of substrates with peroxides, e.g. in waste treatment and as label for antigens.

This present sequence contains substitutions at This911e. Phe46Leu, and Ile107Phe, which have been shown to enhance the peroxidase activity of Mb. These protein can be used to catalyse oxidation of a substrate by peroxidase, e.g. oxidation of Mn2+. Peroxidases are used for oxidising phenolics to polymers, as labels for e.g. antigens, antibodies or oligonucleotides, in diagnostic assays and for oxidative treatment of waste streams. NB. This sequence is not given in the specification but was created from the wild type sequence given by the inventors: The positions of the substitutions given do not include

This present sequence contains a substitution at lys45Glu, which has been found to enhance the peroxidase activity of the protein in general, and it may also exhibit enhanced Mn(II) peroxidase activity of the activity as well. This is due to the enhanced rate of reaction of Fe(III) Mb with hydrogen peroxida and also because the substitution at residue 45 creates a new Mn binding site which is stronger than the natural Mn binding site of Mb. This protein also contains a substitution at Lys63Glu, which was also found to be required for Mn binding, and a substitution at His97Leu to increase the rate of Mn(II) turnover. These protein can be used to catalyse exidation of a substrate by peroxidase, e.g. oxidation of Mn2+. Peroxidases are used for oxidising phenolics to

Mb with hydrogen peroxide and also because the substitution at residue 45 creates a new Mn binding site which is stronger than the natural Mn binding site of Mb. This sequence also contains substitutions at Thr391le, Phe46Leu, and Ile107Phe, which have been shown to enhance the peroxidase activity of Mb.These protein can be used to catalyse oxidation of a substrate by peroxidase, e.g. oxidation of Mn2+. Peroxidases are used for oxidising phenolics to polymers, as labels for e.g. antigens, antibodies or oligomuclectides, in diagnostic assays and for oxidative treatment of waste streams. NB. This sequence is not given in the specification but was created from the wild type sequence given by the inventors. The positions of the substitutions given do not include the

Sequences AAW62270-W62273, and AAW29739-W29744, are modified synthetic horse heart myoglobin (Mb) proteins, produced by random mutagenesis of the synthetic Mb gene. This present sequence contains a substitution at Lys45Glu, which has been found to enhance the peroxidase activity of the protein in general, and it may also exhibit enhanced Mn(II) peroxidase activity as well. This is due to the enhanced rate of reaction of Fe(III)

substrates with

New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer.

Example 2; SEQ ID NO 2899; 1185pp; English.

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC30899) and the polypeptides they encode (ADC30890-ADC31860). The invention allow relates to nucleic acid sequences over 99% identical with the newel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of adainst a polypeptide of the invention; and methods of polynucleotides or polypeptides of the invention; and methods of invention in multibodies of carriving out the methods of the invention. The invention further discloses methods of peventing, treating or and/or monofolonal antibodies for carrying out the methods of the invention invention; methods for the identification of compounds that modulate the expression or activity of the polymucleotide and/or polypeptide; and 767 contigs sequences corresponding to the cDNA sequences of the invention (ADC31661-ADC32627) and the polypeptides encoded by the contigs (ADC32628 ADC333394). The mucleic acids and polypeptides of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the classification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of disease and other neurodegenerative diseases, anaemia, platelet cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptide are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence encoded bolypeptide sequence used in an example of the invention. Note: or moded polypeptide sequence used in an example of the invention. The present sequence of the invention. The present sequence of the plant did not form part of the promiser. specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

This present sequence contains a substitution at Lys45Glu, which has been found to enhance the peroxidase activity of the protein in general, and it may also exhibit enhanced Mn(II) peroxidase activity of the protein in general, and it may also exhibit enhanced Mn(II) peroxidase activity of the protein in general, and also because the substitution of reaction of Fe(III) Mb with hydrogen peroxide and also because the substitution at residue 45 creates a new Mn binding site which is stronger than the natural Mn binding site of Mb. This protein also contains a substitution at Lys53Glu, which was also found to be required for Mn binding, and Uys53Glu, which was also found to be required for Mn binding, and consistiutions at His97Leu and Ser92Ala to increase the rate of Mn(II) turnover. These protein can be used to catalyse oxidation of a substrate by peroxidase, e.g. oxidation of Mh2. Peroxidases are used for oxidising phenolics to polymers, as labels for e.g. antigens, antibodies or cligonucleotides, in diagnostic assays and for oxidative treatment of was created from the wild type sequence given by the inventors. The positions of the substitutions given do not include the initiation codon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Heart; myoglobin; Mb; random mutagenesis; peroxidase activity; Fe(III); Mn(II) peroxidase activity; hydrogen peroxide; Mn binding site; catalyse; phenolic; polymer; antigen; antibody; diagnostic assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New modified myoglobin with amino acid alterations has increased peroxidase activity - used for catalysing oxidation of substrates with peroxides, e.g. in waste treatment and as label for antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Smith M;

Patent No. 6125331
GENERAL INFORMATION:
APPLICANT: TOH, Hiroyuki
TITLE OF INVENTION: STRUCTURAL ALIGNMENT METHOD MAKING USE OF A DOUBLE
TITLE OF INVENTION: DYNAMIC PROGRAMMING ALGORITHM
FILE REFERENCE: 9200-0001-2 GDFGADAQGAMNKALELFRKDIAAKYKELGYQG 153 121 q

                                                                                                                                                                                                                                                                                                                                                        Sequence 65, Application US/08484686B
Patent No. 5827693
GENERAL INFORMATION:
APPLICANT: De Angelo, Joseph
APPLICANT: Bajwa, Wajeeh
TITLE OF INVENTION: Expression of Recombinant Hemoglobin and
TITLE OF INVENTION: Hemoglobin Variants in Yeast
NUMBER OF SEQUENCES: 71
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 141;

GENERAL INPORMATION:

APPLICANT: Boincent, Inc.

APPLICANT: Debe, Derek

APPLICANT: Danzer, Joseph

TITLE OF INVENTION: THREE DIMENSIONAL STRUCTURES OF PROTEIN FAMILIES AND FAMILY MEMBE

TITLE OF INVENTION: METHODS OF USE THEREOF

FILE REFERENCE: 261/210

CURRENT PAPLICATION NUMBER: US/09/791,537

CURRENT FILING DATE: 2001-02-22

NUMBER OF SEQ ID NOS: 153055

SOFFWARE: PatentIn version 3.0

SEQ ID NO 102872

LENGTH: 154

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A, Molecule type: protein
A, Residues: 1-60 < EDM>
A, Note: this was the first sequence determined using the modern sequenator
C, Comment: This myoglobin was isolated from skeletal muscle.
C, Superfamily: globin, globin homology
C, Keywords: chromoprotein, heme; iron; metalloprotein; muscle, oxygen carrier
F,2-147/Domain: globin homology < GLB>
F,64/Binding site: oxygen (His) (distal axial ligand) #status predicted
F,93/Binding site: heme iron (His) (proximal axial ligand) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      myoglobin - Amazon dolphin
C;Species: Inia geoffrensis (Amazon dolphin)
C;Date: 27-Nov-1985 #sequence_revision 27-Nov-1985 #text_change 03-Mar-2000

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    myoglobin - California gray whale

C;Species: Eschrichtius robustus, Eschrichtius gibbosus (California gray whale)

C;Species: Eschrichtius robustus, Eschrichtius gibbosus (California gray whale)

C;Date: 01-Sep-1981 #sequence_revision 01-Sep-1981 #text_change 03-Mar-2000

C;Accession: A02499

R;Bogardt Jr., R.A.; Dwulet, F.E.; Lehman, L.D.; Jones, B.N.; Gurd, F.R.N.

Biochemistry 15, 2597-2602, 1976

A;Title: Complete primary structure of the major component myoglobin of California gray

A;Reference number: A02499; MUD: 76232191; PMID: 938629

A;Residues: A02499; MUD: 76232191; PMID: 938629

A;Residues: 1-153 <BOG>
C;Comment: This myoglobin was isolated from skeletal muscle.
C;Superfamily: globin, globin homology
C;Keywords: chromoprotein; heme; iron; metalloprotein; muscle; oxygen carrier
F;C-17 Domain: globin homology (GIBS)
F;64/Binding site: oxygen (His) (distal axial ligand) #status predicted
F;64/Binding site: heme iron (His) (proximal axial ligand) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

C; Comment: This myoglobin was isolated from skeletal muscle.
C; Superfamily: globin; globin homology
C; Stywords: chromoprotein; heme; iron; metalloprotein; muscle; oxygen carrier
F; 2-14/, Domain: globin homology (distal axial ligand) #status predicted
F; 64/Binding site: heme iron (His) (proximal axial ligand) #status predicted
